CONGRATULATIONS AND WELCOME ABOARD YOUR NEW BAYLINER!

Thank you for choosing our product. Bayliner, a division of US Marine, is committed to the goal of manufacturing the highest quality products in the marine industry, and to providing the finest after-the-sale support in the world. To keep our respected status as the number one recreational boat builder in the world, US Marine has instituted an ongoing TOTAL CUSTOMER SATISFACTION PROGRAM. The guiding principles of this program are:

- Design, build and support the finest marine products in the world, in every market we serve.
- Be personally and individually responsible for the customer’s total satisfaction.
- Remember that every customer has a choice, and we want them to choose US Marine!

Welcome to the US Marine family. We'll look forward to serving your boating needs, now and in the future!

BAYLINER a division of US Marine, a Brunswick Company
Welcome Aboard

This manual has been prepared to assist you in the operation and care of your Bayliner Motoryacht. Please read through it completely, as familiarization with its contents can contribute to the safe and effective operation of your boat.

Your Bayliner yacht is part of a carefully engineered, power-matched package which includes a motor (or motors) designed to provide optimum performance and utility. Installation of a different motor or other accessories, such as trim tabs, may cause undesirable handling characteristics. Should you choose to have a different motor installed, or to add accessories that will affect the boat's running trim, have an experienced marine technician perform a safety inspection and a handling test before operating your boat by yourself again.

Your boat's mechanical and electrical systems were designed to meet safety standards in effect at the time the boat was built. Some of these standards were mandated by Federal law, others are considered industry norms. All of them were designed to insure your safety, and the safety of other people, vessels and property around you. To maintain the integrity and safety of your yacht, only qualified people should perform maintenance on, or in any way modify, the steering, propulsion, engine control, fuel, environmental control, or electrical systems. Failure to maintain these systems as designed could violate Federal law, and could expose you and other people to the danger of bodily injury or accidental death. We recommend that you follow the instructions provided in this handbook, in the engine owner's manual, and in the accessory instruction sheets included with your yacht. We also recommend that you perform the following steps:

1. Make certain that you receive a full explanation of all systems from the dealer before taking delivery of your boat. Your selling dealer is your key to service. If you experience any problems with your new Bayliner, immediately contact the dealership. If for any reason your selling dealer is unable to help, call us direct on our customer service hotline for assistance. The number is (206) 435-8957.

2. Read this manual thoroughly, paying particular attention to the subjects of fueling, checking for fumes, starting, carbon monoxide, alcohol stoves, loading limits, trim tabs, recommendations for safety, and warranty.

3. Practice—all members of the family should be familiar with the operation and systems of your yacht.
4. Participate in a safe boating course. Call the local office of the United States Power Squadrons or the United States Coast Guard Auxiliary for the date and location of their next class.

The hazard warning symbols shown below are used throughout this manual to call attention to potentially dangerous situations which could lead to either personal injury or product damage. We urge you to read these warnings carefully and follow all safety recommendations.

⚠️ DANGER

The symbol shown above alerts you to immediate hazards which WILL cause severe personal injury or death if the warning is ignored.

⚠️ WARNING

The symbol shown above alerts you to hazards or unsafe practices which COULD result in severe personal injury or death if the warning is ignored.

⚠️ CAUTION

The symbol shown above alerts you to hazards or unsafe practices which COULD result in minor personal injury, or cause product or property damage if the warning is ignored.

⚠️ NOTICE

The symbol shown above calls attention to installation, operation or maintenance information which is important to proper operation, but is not hazard-related.
There is information in this manual related to the following Bayliner yachts:

</tbody>
</table>

Due to our commitment to product improvement, we reserve the right to change, without notice or other obligation, the specifications or information contained in this publication.

A WARNING

A qualified operator should be in control of the boat at all times. Do not operate your boat while under the influence of alcohol or drugs. Never operate your boat at speeds which exceed your ability to react if an emergency develops. At night, turn on the appropriate running lights and cruise at a reduced speed that will allow you plenty of time to avoid dangerous situations.

PREPARATION

Prior to leaving on your first outing (or, for that matter, any outing) there are certain items to check and activities to perform. Familiarize yourself with your yacht while dockside, and consider the following suggestions:

Recommendations for Safety

1. Personal Flotation Devices:
One Coast Guard approved personal flotation device (PFD) of suitable size is required for each person aboard a recreational boat. New PFDs bearing Coast Guard approval are now identified as Types I, II, III, or IV.

Requirements for boats sixteen feet (16') or over in length: One (1) Type I, II, or III (wearable) PFD for each person on board, and one (1) Type IV (throwable) PFD in each boat.

2. Always have children wear PFDs. Always check those devices intended for young children for fit and performance in the water. Never hesitate to have "all hands" wear lifesaving devices whenever circumstances cause the slightest doubt about safety.

3. Do not overload or improperly load your boat. Maintain adequate freeboard at all times. Consider the sea conditions, the duration of the trip, the weather and the experience of the personnel on board.

⚠️ D A N G E R

Do not allow anyone to ride on parts of the boat that were not designed for such use. Sitting up on seat backs, bow riding, gunwale riding, or lounging on forward sundeck cushions while underway can be especially hazardous.

4. Falls are the greatest cause of injury both afloat and ashore. Eliminate tripping hazards wherever possible, make conspicuous those that must remain, and require that everybody on board wear proper footwear.

5. Understand the meanings of navigation buoys, and never moor to one. (It is a Federal offense.)

6. Know the various distress signals. A recognized distress signal used on recreational boats is to slowly and repeatedly raise and lower the arms outstretched to each side.
7. Listen to a reliable weather forecast and be guided accordingly.

8. A special flag (red with a white diagonal stripe, or blue and white international "Alpha") flown from a boat or buoy means diving operations are underway nearby. Approach with caution and stay clear by at least 25 yards.

9. Make sure your boat's motor is shut down before allowing people to swim to or from your boat, or to swim anywhere near your boat. Before lowering the transom boarding ladder, shut the motor OFF and remove the key from the ignition switch so that nobody will accidentally start the motor while swimmers are nearby. Also, slow down and exercise extreme caution any time you are cruising in an area where there might be swimmers or water skiers in the water.

10. Watch your wake. It might capsize a small craft. You are responsible for damage caused by your wake. Pass through anchorages at minimum speed.

11. Learn and abide by common boating "rules of the road".

12. Always have up-to-date charts of your cruising area on board.

13. Keep an alert lookout. Serious accidents have resulted from failure in this respect.

14. Always instruct at least one person on board in the rudiments of boat handling in case you are disabled or fall overboard.

15. Consider what action you would take under various emergency conditions such as a person overboard, fog, fire, a damaged hull or other bad leaks, motor breakdown, severe storm or collision.

16. If your boat ever capsizes, remember that if it continues to float, it is usually best to remain with it. You are more easily located by a search plane or boat.

17. Keep firefighting and lifesaving equipment in good condition and readily available at all times.

18. Do not test fire extinguishers by squirting small amounts of the agent. The extinguisher might not work when needed. Always follow approved instructions when checking fire extinguishers.

19. Have an adequate anchor and sufficient line (at least six times the depth of the water) to assure a secure hold in all types of weather and sea conditions.

20. Boat hooks are valuable when docking or when needed to retrieve objects that have fallen overboard.

21. Keep electrical equipment and wiring in good condition. No knife switches or other arcing devices should be installed in fuel or engine compartments. Allow ample ventilation around batteries.
22. Good housekeeping in your boat is important. Cleanliness diminishes the probability of fire.

23. Know your fuel tank capacity and cruising range. If it is necessary to carry additional fuel, do so only in proper containers. Take special precautions to prevent the accumulation of fuel vapors in confined spaces.

24. Before departing on a boat trip, you should advise a responsible friend or relative about where you intend to cruise. Be sure to give that person a good description of your boat. Keep them advised of any changes in your cruise plans. These precautions will enable your friend or relative to tell the Coast Guard where to search for you and what type of boat to look for if you fail to return. Be sure to advise the same person when you complete your trip to prevent any false alarms about your safety.

25. Your local United States Coast Guard Auxiliary and the United States Power Squadrons offer safe boating classes several times a year. These are comprehensive courses, and are generally of minimal cost to you. Call your local U.S. Coast Guard Auxiliary or Power Squadron Flotilla for the time and place of their next class.

Safety Equipment

The following safety-related items should be considered as part of your standard equipment:

1. Fire extinguishers (correct number and type with unexpired dates, located for easy access)
2. Personal flotation devices
3. Fenders, lines and boat hook
4. Flares (night and day type)
5. Flashlight(s) with extra batteries
6. Charts of your intended cruising area
7. First aid kit
8. Anchor and adequate line

Tool Chest

1. Assorted screwdrivers (Phillips and flat blade)
2. Pliers (regular, vice-grip, and water pump)
3. Wrenches (box, open-end, allen, and adjustable)
4. Socket set (metric and U.S. standard)  
5. Hacksaw with spare blades  
6. Hammer  
7. Battery jumper cables  
8. Electrical tape  
9. Assorted fasteners  
10. Gear grease and penetrating oil  
11. Feeler gauges

**Miscellaneous Items**

1. Engine and accessories manual  
2. Spare propeller with fastening hardware  
3. Propeller shaft packing material  
4. Spare propeller shaft and strut  
5. Extra V-belts  
6. Engine lubricating oil  
7. Transmission fluid  
8. Spare fuel and oil filters  
9. An extra cooling pump impeller  
10. Portable fuel can  
11. Replacement light bulbs  
12. Spare set of spark plugs and other ignition parts for gas engines  
10. Replacement fuses

**Static Float Attitude**

The static floating attitude of your boat can be affected by many variables. Optional equipment and loading of gear are the biggest contributors to a boat's list. After launching, the floating attitude of any new boat can be adjusted. If your boat lists to one side, load heavy items on the opposite side until the boat floats more level. Load the remainder of your gear evenly after that.
Other Tips

1. When commissioning a new boat, do not plan an extensive trip or party until you have had a shakedown cruise to make sure all equipment on your boat is functioning properly and you are familiar with its operation.

2. Use big fenders or fender boards to protect your boat’s hull whenever mooring next to floats, piers or other boats.

3. Carry plenty of line that is properly sized to your boat. We suggest at least four 50’ lengths of 1/2” nylon line for boats up to 34 feet, and four 60’ lengths of 5/8” nylon line for boats over 34 feet.

4. Federal law requires you to post a trash and garbage disposal plan. These are available from your Bayliner dealer.

OPERATING

Launching

1. Your Bayliner yacht may be equipped with a transom drain plug. Make sure this plug is tightly in place.

\[\text{CAUTION}\]
Failure to install the drain plug securely will result in the boat filling with water when it is launched.

2. Inspect the bottom of your new yacht and make a mental note of the locations of all fittings below the waterline.

3. After the boat has been lowered into the water, immediately board it and inspect the lower compartments and around the through-hull fittings for signs of leakage.

4. If any leaks are noted, immediately remove the boat from the water. The selling dealer should be notified so the leaks can be repaired before relaunching the boat.
Fueling Procedures

The following procedures apply primarily to gasoline engine-powered boats. However, by learning and using these steps, an extra margin of safety will be realized when fueling your Bayliner yacht equipped with diesel engines.

**WARNING**
Fuel vapors are explosive and can become trapped in the lower portions of a boat where they might be ignited accidentally. While fueling, all doors, hatches, and portlights must be closed.

**WARNING**
Do not use fuels that incorporate any form of alcohol or alcohol derivatives. Alcohol destroys marine fuel system hoses and components, which could lead to hazardous leaks, fire or explosion.

1. Be sure that your boat is securely moored to the dock.

2. Turn off all electrical equipment, including engines, generator, appliances, bilge blower, lights, etc.

3. Extinguish all cigarettes, cigars or other items that may produce a spark or flame.

4. Close all openings including hatches, windows, doors and portlights.

5. Through-deck fittings are provided for fuel tank filling. Remove the cap and insert the fuel supply nozzle, allowing the nozzle to maintain contact with the fitting; this will prevent possible static sparking.

6. After about 10 gallons have been pumped into the tank, inspect the engine and tank area for signs of fuel leakage. Proceed with fueling if no problems are detected.

7. Often you won't be able to fill the fuel tank to 100% of its dry-rated capacity. This is because the amount of fuel the tank will hold depends, in part, on the boat's floating attitude, which in turn affects the position of the fuel tank and its venting system. If fuel flows out the tank vent on the side of the boat, discontinue fueling.
immediately. The tank will be as full as possible under the current conditions. It is advisable not to overfill the tank, as you want to allow for thermal expansion of the fuel, especially on very hot days.

8. If, when filling the tank, you can't put fuel in at a reasonable rate, check the fuel vent line to see that it's not kinked or plugged.

9. When you have finished fueling, replace the fill cap and wash off any fuel spillage.

10. Open the engine compartment and all windows, doors, and hatches; inspect, both visually and by smell, for fuel fumes or leakage. Any sign of fuel leakage, or any indication of fumes, must be investigated and corrected prior to starting the engine.

Starting

The engine operating and maintenance manual furnished with your motor describes prestart and starting procedures. The following notes are basic reminders, and are not intended to cover every detail of engine starting. We urge you to thoroughly read and understand your engine owner's manual.

1. Check the lubricating and cooling fluid levels.
2. Visually check for fuel, oil, coolant, and exhaust leaks.
3. Check that fuel supply and return (diesel only) are open.
4. Check that seawater intake valves (seacocks) are open.
5. Visually inspect the water separators (if equipped) for moisture or contamination.
6. Visually inspect seawater strainers for debris.
7. Check all V-belts for correct tension.

8. Turn battery switch to the ON position.

9. Make sure the emergency engine shutdown switch cap is in place and the lanyard is attached to the operator if your boat is so equipped.

**WARNING**

A serious accident can occur if the emergency engine shutoff switch lanyard is not fastened to the boat operator. In order for the emergency engine shutdown system to operate correctly, the lanyard must be physically attached to the operator (around the wrist or securely fastened to a stout piece of clothing, such as a belt, etc.).

**WARNING**

Gasoline vapors are highly explosive. To prevent a possible explosion and fire, check the engine and fuel compartments before each engine start for fumes or accumulation of fuel. Always operate the bilge blower for at least four minutes before engine starting, during the starting process and anytime you are operating your boat below cruising speeds.

10. Operate the bilge blower for at least four minutes prior to starting the engine. Leave the blower on until the boat is underway and up to cruising speed, then turn it off. Always have the blower running when operating at idle speeds.

11. Before starting the motor, ensure your boat is in deep enough water to lower stern drive unit. Lower stern drive unit down to its normal running trim position by activating the trim switch on the throttle lever’s handle.

12. Move the shift lever to the NEUTRAL position, then move the throttle lever to the IDLE/START position.

13. Turn the DC ignition breaker switches ON.

14. For a low temperature start (below 14°F/-10°C) with diesel engines use the preheater system. Hold the button in for 15 to 30 seconds (do not exceed 30 seconds).
15. Turn the ignition key clockwise to start the motor, releasing the key when the motor starts. If equipped with twin engines start the port engine first, then start the starboard engine. If you are starting a cold engine, you can enrich the starting mixture by activating the choke. Most stern drive and inboard engines will choke automatically when you set the throttle as described in the previous step, though you should refer to the engine owner's manual for the exact procedure that applies to your engine.

16. **DO NOT** continuously operate the starter for more than 15 seconds at a time. Allow at least three minutes for cooling between start attempts.

17. Warning alarms may activate upon engine start. These devices are intended to call your attention to the condition of one or more of the engine's subsystems. Generally, there are two times when warning alarms will sound. The first is upon initial engine start, where the alarm will sound from about 7 to 14 seconds. This indicates that the warning system is working so that if a malfunction occurs later, you can be fairly certain the alarm will sound again to alert you to the problem. The other situation where you'll hear an alarm is when there is actually something wrong with one of the engine subsystems. Conditions causing an alarm to sound are things like high engine coolant temperature, low engine oil pressure, or low oil level in the stern drive unit. The exact meaning of each alarm varies depending on the engine manufacturer, and not every engine has all of the alarms mentioned above. We recommend that you refer to the engine owner's manual that came with your motor for more specific information.

18. Check the oil pressure, voltmeter and temperature gauges immediately after the engine starts. Also inspect the engine compartment for fuel, cooling, or exhaust system leaks that were not apparent before you started the motor.
WARNING

Carbon monoxide is a poisonous gas that is colorless, odorless and heavier than air. It can accumulate in the lower regions of the boat in dangerous concentrations if proper ventilation is not provided. A person breathing these fumes could become seriously ill or even suffocate. Always run the bilge blower and open windows or hatches whenever the engine is idling. Also, never operate the engine when either the slant cover or the camper cover is installed.

19. Once the motor has been started, allow it to warm-up for several minutes before getting underway.

20. Check steering operation by turning the steering wheel full port and starboard while observing the rudder or outdrive movement.

WARNING

On boats with dual control installations, always move the throttle lever to the IDLE position before moving the shift lever to either the FORWARD or REVERSE positions. Failure to do so can cause transmission damage and possible injury or death.

Before You Leave

Provided you have not encountered any problems, you are almost ready to go. (If you did encounter problems, do not attempt to operate your boat until they are corrected.) Before you leave, perform the following steps:

1. Check the operation of equipment such as bilge pumps, running lights, wipers, radios, etc.

2. Instruct passengers in the use and location of flotation devices and fire extinguishers.

3. Obtain a reliable weather forecast and plan accordingly for everyone's comfort and safety.

4. Notify a responsible friend or relative of your cruise plans. Upon your return or a change in your cruise schedule, notify that person again in order to avoid unnecessary concern.

5. Fill potable water tanks.

6. Inform passengers of the trash and garbage disposal laws and your disposal plans.
Maneuvering

When all of your predeparture checks have been completed, you will be ready to leave the dock.

Basic Maneuvering

Steering your yacht at either idling or cruising speeds will generally require minimal effort. However, you may notice that the helm wheel may pull in one direction or the other, depending on whether the boat is traveling in forward or reverse gear. This is caused by the torque reaction of the propeller, which causes the stern of the boat to be pulled to one side as power increases, especially when starting from a fully stopped position. This is a normal condition that takes some getting used to. Practicing maneuvers at slow speeds will help you to become familiar with all the special handling characteristics associated with your boat.

Remember that all boats steer by the stern (the feeling is much like steering your automobile in reverse). This means that the stern of your boat will swing in the direction opposite to your turn. For example, when you turn the helm wheel to the left, the stern of the boat will swing to the right as the boat goes into a left turn. This is especially important to keep in mind when docking, when operating in close quarters with other boats, or when approaching a swimmer or downed skier in the water.

If your boat has twin propellers, you can engage one engine in forward gear and the other in reverse gear to turn the boat completely around in its own length. Usually the rudder is left in the centered position. You can make such a turn in either direction. Port engine forward and starboard engine in reverse spins you clockwise. Starboard engine forward and port engine in reverse spins you counterclockwise. You usually can increase the rate of spin by turning the rudder in the direction of the spin.

Always use extreme caution when approaching someone in the water. Approach them at idle speed only, allowing your stern to swing away from them as you get close. Place the shifter in NEUTRAL and shut off the boat's motor when you are still several feet from the person in the water. While they are swimming over to the boat, lower the swim ladder from the transom platform so they can board. Once everyone is aboard, return the swim ladder to its stowed position and check that everyone is safely seated before restarting the motor. If you are unfamiliar with picking up swimmers in the water, practice this maneuver with a retrievable floating object before attempting it under actual conditions.

Boats have no brakes. Stopping is accomplished by backing down on the throttle. Once the boat has slowed and the motor is idling, place the shifter in REVERSE. Gradually increasing reverse power with the
throttle will allow you to stop the boat in a very short distance. Note that a boat will not respond to steering in reverse nearly as well as it does when going forward, so do not expect to accomplish tight turning maneuvers when backing up.

Once you are away from the dock, devote some time to learning how to maneuver.

- Practice docking by using an imaginary dock.
- Practice stopping and reversing.
- When operating in close quarters or docking, all maneuvering should be done at idle speed. Proceed with caution in congested areas.
- Gradually increase your speed. Get used to the boat before attempting any full throttle operation.

**Docking**

*Preparation:*

Proper docking requires preparation. Start by making sure you have adequate mooring gear, and that it is stowed correctly and is ready for use. Your dealer is the best source for information concerning the amount and type of equipment you should carry.

*Approaching the Dock:*

When approaching a mooring area, lower your speed within a reasonable distance to allow your wake to subside before it reaches other boats or docks. As you get close to your moorage, check for any
wind or current action that may affect your maneuver; then make a
conservative approach with these factors in mind. Try to use the ele-
ments to your advantage. Allow them to carry the boat into the dock. If
there are high winds or strong currents, it is best to approach the moor-
age from the lee side. With a mild current and little or no wind, it is best
to approach from the windward side. While approaching, check to see
that all lines are attached to the cleats on the side facing the moorage.
Also insure that fenders are lowered on that side. Be sure to check that
the fenders are hung at the proper height.

As you approach your moorage, it is desirable to have one person at
the bow and one at the stern of the boat, each with a boat hook and a
mooring line attached to a cleat. Approach at idle RPM at an angle
approximately 45 degrees to the dock. When the bow is within a few feet
of the dock (starboard side), the stern can be brought alongside the
moorage by turning hard to port. Next, turn to starboard and at idle RPM
put the boat into REVERSE. This will stop the boat and bring the stern
even closer to the dock. These steps are reversed for docking to port.

Mooring:
To attach lines to deck cleats, make a loop in one end of the line and
pass it through the hole in the base of the cleat; then pass the loop back
over the entire cleat. The line can now be used to secure your boat.
Lines may be kept this way while underway as long as they are coiled
and cannot become fouled in deck gear or props. In heavy sea condi-
tions, all lines should be removed from the decks.

**WARNING**

Whenever you are towing another boat, or having your
boat towed, make sure the towline is fastened securely
to the bow or transom towing eyes only. Never attach a
towline to deck cleats or the anchor windlass (if so
equipped), as serious injury may result if the cleats or
windlass pull free from the deck. Also, to reduce the
danger created by a potential failure of the towline,
everyone should stay well clear of the towline attach-
ment points on both the towing and the towed boats.

Leaving the Dock:
Take into account wind, tide, current and other forces that affect your
maneuvering as you leave the dock. Most maneuvering to and from a
dock is best accomplished at idle speeds.
Do not forget to release the mooring lines and stow the fenders.
When leaving a moorage on your starboard side and your bow
cannot be pushed away from the dock first, start forward with the helm wheel turned to starboard for two or three feet. Then shift to REVERSE with steering full to port. Repeat if necessary to get the stern far enough away from the dock so you can back clear of any other boats that may be moored ahead of you. (Reverse wheel directions when leaving a dock located to port.)

**Boat Performance**

Boat speeds are affected by a great many factors. Some, such as temperature and altitude, you cannot change, but some factors you can:

1. **Loading:** Take only necessary equipment with you. Keep weight low in the boat and balanced.

2. **Propeller(s):** Keep them in good repair and at the correct pitch for your particular situation. The factory standard equipment propeller(s) may not be the best for your particular boat and load conditions. If the engine RPM at full throttle is less than the maximum rating, try a prop of less pitch. If the engine RPM exceeds the maximum rating, try a prop of greater pitch.

   A slightly bent or nicked propeller will adversely affect the performance of your boat.

3. **Weeds, barnacles and other growth:** Keep your boat's bottom clean. When your boat starts “growing grass”, it will slow down greatly.

**Boat Running Attitude**

1. If your boat runs with its bow too high at cruising speeds, the following suggestions will help you achieve a more correct cruising attitude:
   - Move some weight forward in the boat.
   - Adjust the trim tabs. (See the Trim Tab section below.)
   - On stern drive models you can adjust the thrust angle of your stern drive (reduce the distance between the bottom of the transom and the drive unit). See your engine owner’s manual for trimming instructions.

2. If your boat runs with its bow too low at cruising speeds (usually indicated by water coming off the hull far forward and steering difficulty or veering off course), you can raise the bow by performing steps opposite of those above.
Trim Tabs

Trim tabs are intended for corrections to boat trim on the port and starboard axis; however, they may also create very minor changes in pitch (fore and aft) attitude. For major corrections, redistribute loads.

1. If the tab position is unknown, put both tabs in the full bow-up position.

2. After power has been applied and the boat is up to cruising speed, push the appropriate tab button to level the boat from side-to-side. Several short touches of the tab button are recommended, rather than one long one. Allow the boat to react to the new position of the trim tab after each touch. When installed in accordance with the manufacturer's recommendation, the port trim tab switch will operate the starboard trim tab and vice versa.

3. Both tabs can be lowered slightly to lower the bow. However, forcing the bow down too far with trim tabs will cause steering difficulty and a loss of efficiency.

4. When running in a following sea, run trim tabs to the full bow-up position.

WARNING

Improper use of trim tabs can cause a loss of control. Do not use trim tabs in a following sea, as they may cause broaching or other unsafe handling characteristics. Do not allow people who are unfamiliar with trim tabs to operate them.

Instruments

While under way, instruments should be checked frequently for possible indications of trouble.

1. Tachometer—A tachometer is an electrical instrument that indicates engine revolutions per minute (RPM). The tachometer is useful for monitoring engine speed to avoid exceeding the maximum RPM rating. In addition, it can be used to detect performance changes by comparing speedometer readings at various RPMs.

2. Temperature Gauge—The temperature gauge indicates engine coolant temperature by monitoring a signal from a sending unit installed in the engine water jacket. When the gauge reads in the danger area, shut off the engine and diagnose the problem. A
common cause of overheating is picking up a foreign object in the seawater intake. Usually, raising and lowering your outdrive (stern drive models only) will free it. Backing up in reverse gear, then pulling ahead in forward gear for 10-15 feet can be helpful, too. On those twin-engine powered boats equipped with a hot water system, whereby the cooling system of one engine is plumbed through the hot water tank to provide heating for the fresh water supply, the temperature gauge for that engine will indicate a different operating temperature than the other engine.

3. *Oil Pressure Gauge*—The oil pressure gauge indicates engine lubricating oil pressure. Low pressure readings are generally caused by low oil quantity. In any case, immediately shut down the engine and diagnose the problem.

4. *Fuel Gauge*—The fuel gauge indicates approximate fuel level. Since boats are exposed to rough water conditions and varying degrees of trim, it will not always be possible to fill the fuel tank to 100% of its dry-rated capacity. Therefore, fuel gauges may seem to provide inaccurate readings at times. It is always good to keep track of the amount of fuel you pump aboard, as well as your running time and estimated fuel usage as a double check against an inaccurate gauge.

5. *Compass*—Your boat may come equipped with a compass for use in navigation. Many factors affect the operation of your compass, such as local magnetic variation and deviation (induced needle deflection caused by metal components and the operation of electrical equipment aboard your boat). Each compass must be “swung” (compensated) to adjust for individual boat characteristics, and for the particular compass installation. It is vitally important, therefore, that you have your compass professionally swung before using it for marine navigation. Your Bayliner dealer can refer you to local shops that perform this work.

**Dual Station Operation**

Always start the engine at the station from which you will be operating the boat. Remind everyone near the unattended control station to KEEP HANDS OFF. When leaving one station to begin operating at the other, bring the boat to a complete stop. Never leave the helm while the boat is underway and assume that someone else has the boat under control. If you are operating your boat at the bridge and you encounter heavy sea conditions, bring your boat down to an idle, point it into the sea and have bridge passengers move down to the cabin. If sea condi-
tions become very heavy, you should also leave the bridge and operate your boat from the lower station. Children should be required to wear life jackets.

**Diesel Engine Shut-Down**

1. Cool the engine down gradually, allowing it to idle in neutral for at least five minutes.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gradual cool-down of a turbocharged engine is absolutely necessary to avoid shortened turbocharger life.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>It is important to follow steps 2, 3, 4, and 5 in sequence to avoid the possibility of electrical system damage.</td>
</tr>
</tbody>
</table>

2. To turn the engine off, push the STOP button.

3. After the engine stops, turn the ignition key counterclockwise to the OFF position.

4. Turn off the DC ignition breaker switches.

5. Turn off the battery switch.

6. Close the seawater intake valve.

7. Close the fuel supply and return (diesel only) valves.

8. Carefully inspect the engine and engine compartment for indications of oil, fuel, water, or exhaust leakage.

<table>
<thead>
<tr>
<th>NOTICE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steps 6, 7, and 8 need not be followed for short term shut-down (overnight). For long-term storage, refer to the “STORAGE” section of your engine owner's manual.</td>
</tr>
</tbody>
</table>
Grounding

Running aground is often merely inconvenient but in extreme situations it may also be dangerous. As in any emergency situation the most important thing to do is remain calm, don't panic. If you find yourself aground resist the temptation to immediately put the engine in reverse and gun the engine in an attempt to back off. If the boat has grounded in mud or sand this may only cause the prop to blow more mud or sand under the boat making it even more firmly grounded. In addition, it may also get the mud or sand into the engine water intake and up into the engine itself. Following are some brief explanations of possible actions to take in event of grounding. More thorough information is available through the U.S. Coast Guard Auxiliary or U.S. Power Squadrons.

1. Shift to NEUTRAL and set the throttle to idle.

2. Check the hull to see whether it has been punctured and is taking on water. If so, immediately switch on the bilge pumps. A hand operated bilge pump is a good safety item to have aboard in case the electric pumps cannot remove the water fast enough. The engine's cooling pump can also be brought to use by shutting down the engine, shutting off the seacock, disconnecting the water hose and fitting the end with a filter screen; then putting the end of the hose into the water in the bilge and restarting the engine. Check frequently that the engine cooling system has a continuous supply of water. Canvas, cushions, or even bedding can be used as temporary patches to the outside of a stow in hull, hold them in place with docking lines. If taking on water rapidly it may be better to leave the boat grounded than moving her to deeper water where she may sink. Make a "PAN-PAN" (pronounced Pawn-pawn) distress call on channel 16 on the VHF radio, only use the "MAYDAY" distress signal if you or your boat are in grave and immediate danger.

3. If in tidal waters check the status of the tide. If coming in, it may lift the boat enough to get you free. Wakes from passing boats will also help lift you off. If the tide is falling take as many soundings as possible to determine the direction of deepest water. Then fasten the anchor line to the stern cleats, put the anchor and line in the dinghy and row the anchor out to deeper water paying out line from the dinghy. Pay attention to wind and current and set the anchor up wind or current from the boat (this is called kedging). Pull the boat from the grounding by pulling the anchor line and alternating with moderate reverse engine power if necessary. A "block and tackle" or "come-along" will greatly increase your pulling power and are good items to have aboard. If you need assistance make a "PAN-PAN" distress call as stated above.
COMPONENTS/SYSTEMS

Electrical System (12-Volt DC)

1. **Battery**:
All single-engine yachts have one battery that supplies the engine and all 12-volt DC accessories with power. Installation of a second switched battery is recommended, and is easily accomplished by your Bayliner dealer.

All 30' and 32' twin-engine models are equipped with two master battery switches and two batteries. One battery provides starting power for both engines. It also provides power to the autofloat switches for the bilge pumps. This battery is charged by the port engine alternator. The other battery provides power to the 12-volt DC accessories and is charged by the starboard engine alternator. A third battery switch may be installed if the boat is equipped with the generator option.

On the 36' through 43' models, three master battery switches and two batteries are provided. One battery is used for starting both engines and for powering the autofloat switches. It is charged by the port engine. The other battery is used for accessories and is charged by the starboard engine. The third battery switch is a crossover switch between the start and accessory batteries, and is used to start the engines if the start battery goes dead.
The crossover switch should be turned on only in emergencies. Leaving this switch ON can drain all onboard batteries. Also, you should never disconnect battery cables or turn the main battery switch(es) to the OFF position while the motor is running, as this can cause damage to your boat’s electrical components, and possibly could shock you.

The isolation of the charging circuit on the starboard engine is accomplished by the use of a special alternator exciter circuit. This circuit is fused at the accessory battery switch by a 10-amp fuse. The exciter circuit is activated by an oil pressure switch installed on the starboard engine. When the starboard engine is started, the oil pressure comes up, the pressure switch closes, the exciter circuit is energized, and the alternator charges the accessory batteries.

On single-engine models, the condition of the battery can be read on the voltmeter when the ignition switch is in the ON position.

On all twin-engine yachts, the condition of the main starting battery can be read on the port voltmeter when the engine battery switch and the port ignition switch are in the ON position. The condition of the accessory battery can be read on the starboard voltmeter when the accessory battery switch is in the ON position. The starboard ignition switch does not have to be ON to read the accessory battery condition. That means the starboard voltmeter will register the accessory battery state even when the engines are shut down and the ignition switches are turned off.

With the engine not running, voltmeter readings in the 11.5 to 12.5-volt range are considered normal. Readings in the 10 to 11.5-volt range indicate a marginal charge condition. Readings below 10 volts indicate a seriously discharged condition.

With the engine running (over 1500 RPM), voltmeter readings of 13 to 14 volts are considered normal. Readings below this indicate a severely discharged battery or a nonfunctioning charging system.

All 32’ through 43’ twin-engine yachts are provided with electrical system monitors that are fused at the battery switch board. They will show the condition of all factory installed batteries at any time, regardless of battery switch position.

Check the battery electrolyte level regularly. Remove the caps on top of the battery and observe the level of the fluid inside. If the zinc plates are exposed, add distilled water until they are covered.
again. Corroded battery terminals can impair battery performance and charging ability. Clean them with baking soda and water; then coat them with a preservative or a light film of grease. Be sure all battery connections are tight. When storing the boat, it is best to remove the battery, give it a full charge, and store it inside away from extreme temperatures.

2. *Fuses and Circuit Breakers (12-Volt):*
On single-engine 30' models, the engine and accessory circuits are protected by a large "push to reset" circuit breaker located on the engine. These boats are equipped with main fuse blocks, which are located behind the instrument panel. ATC fuses are used for all standard equipment accessories. These circuits operate from one battery switch. Electrical power for trim tabs is taken directly off the battery, and is fused at the battery with a 20-amp in-line fuse.

All other models have breaker panels. Breakers are located on the face of the DC Master Panel, and are marked as to which accessory they protect. Consult the electrical schematics located in the back of this manual for more detailed information.

On all twin-engine models, engine circuits are protected by a large "push to reset" circuit breaker located on the port engine. In addition port and starboard engine circuits are individually protected by circuit breakers on the DC master panel. These engine systems operate off the battery switch marked "Engine". The accessory circuit is separate from the engine circuit and is protected by a circuit breaker located on the battery switch panel, and in some cases, a secondary master breaker located on the DC master panel. This system is operated off the battery switch marked Accessory". In addition, each separate circuit in the accessory system is individually protected by a breaker on the DC master panel. Also located at the battery switch panel are the individual breakers for such items as bilge pump auto-float switches, starboard voltmeter, starboard alternator charging, and anchor windlass.

Some equipment, such as bilge pumps, shower drain pumps, and depth sounders may have secondary overcurrent protection located at the unit. Models equipped with multiple bilge blowers will also have individual secondary breakers which are located at the lower station helm area.
Electrical System (110-Volt AC)

The AC system is energized by either shore power or the onboard generator (optional on some models).

Shore power receptacles are rated at either 30- or 50-amps and appropriate power cords are furnished. Since not every shore installation has 30-amp service, we recommend that 15- and 20-amp adapters be purchased. However, whenever 15- or 20-amp adapters are used, there will be a corresponding drop in supplied power from the dockside system. **Note that you should never hook dockside power to your boat overseas unless you purchased the overseas option, which is rated for 220 volt/50 Hz., whereas standard domestic systems are rated for 110 volt/60 Hz. power.**

![WARNING]

Monitor the electrical control panel’s polarity indicators when connecting shore power to your boat. A green light illuminating after the power cord is plugged into the boat's external power receptacle indicates acceptable electrical power. Therefore, you may energize the main breaker switches. However, a red light indicates reversed polarity, which could cause electrical system damage and possible electrical shock injuries. In this case, **DO NOT** energize the main breaker switches. Instead, immediately disconnect the shore power cord (always from the dockside outlet first) and notify marina management.

Before connecting to shore power ensure all breakers and switches on the AC master panel are in the OFF position. Always attach the shore power cord to the boat inlet first, then to the dock connection, thereby avoiding accidental dropping of the "hot" cord into the water. Correspondingly, remove the dock connection first before removing the cord from the boat inlet.

On models with a single dockside inlet and not equipped with an auxiliary generator, check for proper polarity as outlined above. Activate the AC system by first turning on the master breaker, then each individual component breaker as required.

On models with a single inlet and equipped with an auxiliary generator, the polarity light will work only when connected to the shore power. Activate the AC system by first turning the Ship/Shore selector switch to the desired position. Then switch on the master breaker and each individual component breaker as required. This system is designed so
both ship and shore power sources cannot supply power simultaneously.

On models with dual dockside inlets and not equipped with an auxiliary generator, check for proper polarity as outlined above. Each dockside inlet is labeled inside the weatherproof cover, Line 1 or Line 2, which corresponds to the line each operates on the AC master panel. This system is designed so that each line operates independent of the other. Activate the AC system by first turning on the master breakers, then each individual component breaker as required.

On models with dual dockside inlets and equipped with an auxiliary generator, the polarity lights will work only when connected to the shore power. Activate the AC system by first turning the Ship/Shore selector switch to the desired position. When switched to the "Shore" position, Line 1 inlet corresponds with Line 1 on the master panel and Line 2 corresponds with Line 2 on the master panel. Again, each line operates independent of the other. When switched to the Generator position, both Lines 1 and 2 will operate. Then switch on the master breakers and individual component breakers as required. This system is also designed so that both ship and shore power sources cannot supply power simultaneously.

Whether using shore power or the generator, the simultaneous operation of several 110-volt accessories can result in an overloaded circuit. It might be necessary to turn off one accessory while operating another.

All models with 110-volt receptacles in the head and galley are equipped with ground fault circuit interrupters to protect users from electric shock. This device will also protect other labeled outlets.

Generator

The literature package supplied with your boat has a very complete operator's manual for your generator. We urge you to read that manual prior to operating your generator, and to observe the following:

1. Follow instructions in the operator's manual for prestart checks and break-in procedures.

2. Always operate the bilge blower for a minimum of four minutes before starting the generator. Leave the blower running while the generator is operating unless the main engines are also running.

3. Never operate the starter for more than 30 seconds. If the generator does not start, wait at least 30 seconds before making another starting attempt.
4. In addition to servicing the filters attached to the generator, any separate filter/separators should be serviced as indicated by the instructions included in your literature package.

5. The coolant mixture installed at the factory consists of equal parts of water and antifreeze.

6. The seawater intake valve must always be open during generator operation, and the seawater strainer should be checked frequently for debris.

**Hot Water Heater**

On all models the hot water heater is connected to the 110-volt power system. On those models equipped with freshwater engine cooling, the coolant from the closed engine cooling system is circulated through the hot water tank for heating of potable water. Heaters must be kept full of water to avoid damage to the 110-volt heating elements. They should also be drained (power turned OFF) when the possibility of freezing exists.

**Air Conditioning/Heating**

Both heating and cooling (on boats equipped with air conditioning) are controlled from the same panel. Refer to the Environmental Control Unit booklet supplied in your information packet for detailed instructions concerning proper operation of the heating and air conditioning systems.

**Battery Charger**

On all yacht models, the battery charger operates when 110-volt dockside power is connected and the battery charger circuit breaker is ON. On those models equipped with a generator, the battery charger also operates when the AC source selector switch is on GENERATOR, the generator is running, and the battery charger circuit breaker is ON. The battery charger will charge the batteries regardless of the battery switch position.
Fuel System

⚠️ CAUTION ⚠️

It is very important that the fuel system be inspected thoroughly at the time it is first filled and then at each subsequent filling. For your safety and the safety of your passengers, the fueling instructions in this manual must be followed.

1. Fuel Fills and Vents:
   Fuel fills are located either on the aft deck or on the side decks adjacent to the aft cockpit. Fuel receptacle caps are marked "Fuel" or "Gas". Fuel vents are normally located in the hull or transom below and in the same general area as the fill. If you experience difficulty filling the fuel tank, check to see that the fuel fill and vent lines are free of obstructions and kinks.

2. Antisiphon Valves:
   As required by the U.S. Coast Guard, the fuel systems on all gasoline powered boats are equipped with an antisiphon valve. This valve is an integral part of the barb fitting on the fuel tank to which the neoprene fuel line attaches. The valve is spring loaded and is opened by fuel pump pressure. These valves will prevent gasoline from siphoning from the fuel tank in the event of a fuel line rupture.

⚠️ NOTICE ⚠️

If an engine running problem is diagnosed as fuel starvation, the antisiphon valve should be checked. In the event the valve is stuck or clogged, it should be cleaned or replaced while the engine is shut down. Under no circumstances should it be removed except in an emergency.

3. Fuel Filters:
   All fuel tanks are equipped with a fine mesh screen filter on the fuel pick-up tube in the tank. In addition, when supplied by the motor manufacturer, an additional filter is installed on the engine. Fuel filters should be checked periodically to see that they are clean and free of debris.

4. On models equipped with two fuel tanks, the fuel line from each tank is run to a manifold system equipped with tank selection valves. If the boat is equipped with a generator, there is also a valve on the
manifold for the generator fuel line. Under normal conditions, the boat should be run with the main valves open and, if so equipped, the crossover valve closed. If for some reason one of the tanks runs dry, the valve to that tank can be closed, and both engines can be run off the tank that still has fuel.

---

**CAUTION**

Avoid the storage or handling of gear near the fuel lines, fittings and tanks.

---

5. *Diesel Fuel:*

The diesel fuel system utilized in Bayliner yachts is similar in most ways to the gas system. However, diesel engine operation requires a return fuel line from the engine to the tank. Thus, the fuel system has two lines between the engine and the fuel tank, instead of one. Diesel fuel tanks are not fitted with antisiphon valves. Fuel filters are utilized in every diesel installation. It is very important that the filters be checked and cleaned regularly.

Make sure that your fuel suppliers are reputable and can be relied upon to furnish clean, proper, high quality fuel. Also, once you have found good suppliers, keep your tank as full as possible with their fuel. Then, if you are forced to add to the tank with a potentially poor quality supply, the portion of poor quality fuel will be minimized.

Diesel fuel of ASTM grade 2-D is recommended. The minimum cetane value is 40 (45 for cold temperature operation), and the maximum sulfur content is 0.5%. If the sulfur content exceeds 0.5%, oil changes should be performed twice as frequently as indicated in the engine manual.

Air in the fuel supply system can stop an engine or severely restrict performance. Should air be introduced into your fuel lines, refer to your engine manual for detailed instructions on how to “bleed” it out of the system.

Consult your dealer or local marina concerning fuel additives that help to prevent fungus or other growth in your fuel tanks.

---

**Shaft-Transmission Alignment (Inboard Engines)**

Alignment between your engine transmission output shaft and the propeller shaft is very critical. Although this alignment has been performed at the factory, it should be checked again after the boat has been in the water for 48 hours. Alignment inspection should be performed as part of the routine maintenance program (after the initial 30 hours of
operation, then every 60 hours) and whenever unusual noise or vibration is noticed. To insure proper alignment when the boat has been launched after a haul-out or dry storage, wait for 48 hours before making final adjustments.

Proper alignment is usually achieved by moving the engine. We recommend that alignment be performed by an experienced marine mechanic. However, checking alignment is relatively simple when these procedures are followed:

1. Remove the flange bolts at the transmission-to-shaft coupling and slide the shaft aft until the flanges are about 1/4" apart.

2. Rotate the shaft to see if there is obvious "wobble" of the shaft flange; if there is, it may indicate that the shaft has been damaged.

3. Move the shaft up and down and from side to side to determine, as closely as possible, the central position where the shaft is normally located. At this position, the transmission flange should align with the shaft flange without moving the shaft to either side or raising it more than 1/8". If this is not the case, a misalignment condition exists.

4. Move the shaft flange into contact with the transmission flange. Check the gap between flange faces by attempting to insert a .003" feeler gauge at the top, bottom and each side. Repeat this operation after rotating the shaft flange 1/4 turn (3 times). Misalignment is indicated when the feeler gauge can be inserted easily at any point.

Shaft Log Stuffing Box Packing (Inboard Engines)

The propeller shaft emerges from the bottom of the boat through an opening called the shaft log. The shaft stuffing box is connected to the shaft log by a short length of special flexible hose. Packing rings are compressed around the shaft by the packing nut. The stuffing box prevents excessive amounts of water from leaking around the shaft and into the boat.

Normal wear can cause stuffing box leakage to increase. It usually can be stopped by loosening the locknut, tightening the packing nut slightly, and then resetting the locknut tightly. Do not overtighten the locknut. Bear in mind that a slight leak (up to 10 drops per minute while running) helps to lubricate the packing and is therefore desirable.

When stuffing box leakage becomes excessive, even after following the above steps, packing replacement can be performed as follows:

1. Remove the boat from the water.

2. Loosen the locknut; then back the packing nut off the sleeve.
   Remove the old packing.
3. Wrap new packings around the shaft; then cut the rings with a razor blade at an angle approximately 30 degrees to the long axis of the shaft. Stagger the ends of each ring around the shaft and insure that the rings are fully seated in the packing nut recess.

4. Tighten the packing nut by hand only until resistance of the packing contacting the stuffing box is felt. Then tighten the locknut securely.

5. When initially launched, the packing must be allowed to leak at a rate of about 5 to 30 drops a minute, as it will expand and seal from water contact and friction heat from the turning shaft. Failure to allow this leakoff will result in packing burnout after running for only a short period of time.

Rudder Stuffing Gland (Inboard Models)

As in the case of the shaft log stuffing box, the rudder stuffing gland is part of the assembly where the rudders emerge from the bottom of the boat.

It is very similar to the propeller shaft stuffing box and will require the same maintenance. Since it obviously does not receive the same wear as the propeller shaft, repacking is seldom required. This shaft stuffing gland should not leak water.

Steering

Depending on the model you own, your steering system may be either manually or hydraulically actuated. With hydraulic steering you may notice a rhythmic pulsing when turning the wheel. This is a standard characteristic of the hydraulic pump, and is not a malfunction. Also, when coming off a hardover position, a resistance may be felt followed by a distinct sound. This is a normal situation resulting from the release of the check valve.

The fluid reservoir for the hydraulic steering system is usually located in the aft end of the engine compartment. Following instructions in your literature package and on the reservoir, check the fluid level and pressure regularly.

Refrigerator

The refrigerator operates on 110-volt AC and 12-volt DC power. When the 110-volt system is not operating, the refrigerator operates on 12-volts. When an AC source is supplied by a generator or by dockside power, the refrigerator automatically switches over to the 110-volt power supply.

The refrigerator is the heaviest continuous draw on the 12-volt DC
system. If no other 12-volt accessories are used, the refrigerator can draw a battery dead in less than 24 hours. For this reason it is recommended that when operating on 12 volts, the cold setting on the refrigerator should not be set higher than position two. It is also advisable to turn the refrigerator off at night. If you are going to be out more than one day and cannot connect to dockside power, you should plan to run your generator or engines periodically to maintain a charged battery.

**Seawater Strainers**

Seawater strainers should be periodically checked for debris. Depending on the boat model, there may be strainers for engines, for the generator, for the air conditioning system, and for the seawater washdown pump.

**Exhaust System (Inboard Engines)**

The engine exhaust system is designed to keep water out of the engines in most sea conditions. However, care should be taken not to anchor stern to the sea, and the engines should not be shut off if the seas are too high. Always use good seamanship and consider the sea conditions before anchoring or shutting off the engines.

Check all exhaust system clamps when first launched and after the first 20 hours; then continue to check the clamps periodically after that.

**Marine Head with Holding Tank**

The marine head and holding tank system is designed so that sea water is used to flush waste from the toilet into the holding tank. The holding tank is plumbed to a waste fitting on the deck for use at a dockside pump-out station, and to a macerator pump so that waste may be pumped overboard where regulations permit. The push-button switch for the macerator is usually located at the helm station (lower helm station on command bridge models).

To operate the marine head, open the seacock on the seawater intake. Before using the head, pump some water in to wet the bowl. After use, pump until the bowl is thoroughly cleaned. Pump a few more times to clean the lines. If excess waste should cause the water to rise in the bowl, stop pumping until the water recedes.

If at any time you are unable to pump water into the bowl, the probable reason is debris in the pump diaphragm. To remedy this, shut the inlet seacock and dismantle the pump. The pump is generally held together with six screws. The design is simple and the problem will be obvious when the pump body is split open.

To winterize the toilet, shut off the intake valve and pump until the
bowl is dry. Remove the drain plug in the base and pump again to remove all water. Do not fill the bowl with antifreeze. The inlet seacock should be closed while the boat is left moored unattended.

AM/FM Cassette Stereo

The AM/FM cassette stereo that comes standard with your yacht has a separate brochure that explains its operating features. Note that AM radio reception may be impaired while the engine is running.

Depth Sounder

Your yacht may come equipped with an electronic depth sounder. It will provide you with measurements of water depth beneath the boat. In many cases it also will help you locate schools of fish. The depth sounder comes with its own owner’s manual. We suggest that you read it carefully before turning on the unit.

**WARNING**

The depth sounder should not be used as a navigation aid to prevent collision, grounding, boat damage or personal injury. When the boat is moving, submerged objects will not be seen until they are already under the boat, or bottom depths may change too quickly to allow time for the boat operator to react. Always operate the boat at very slow speeds if you suspect shallow water or submerged objects.

Potable Water System

The water filter should be inspected frequently and cleaned as required.

Sinks and showers ("gray water") drain overboard. Sinks above the waterline are gravity drained, and showers below the waterline are pump drained. Drain pumps should be turned OFF after the shower is drained. Water tanks should be topped-off at every opportunity to avoid the possibility of running short of potable water.

When your boat is to be left unattended for an extended period of time, it is advisable to pump the water tanks dry to prevent stored water from becoming stagnant and distasteful.

Pressure type (demand) systems operate any time the electrical switch for the pump is in the ON position. Make sure the switch is OFF when the boat is not in use, or whenever the water tank is empty. Some models with showers have a manual shower sump switch located in the head.

### Starter Motor

The engine starter motor is designed to deliver high horsepower for only very short periods of time. Avoid operation for more than 15 seconds at one time. Due to its high horsepower, this motor builds up considerable heat and can be permanently damaged with prolonged use. If it does not operate, check the battery charge and all direct wiring for shorts or loose connections. If excess bilge water is allowed to accumulate, the starter can be damaged. Check the operation of the automatic bilge pumps regularly.
Bilge Blower

The bilge blower removes fumes from the engine compartment and draws fresh air into the compartment through the deck vents.

To ensure fresh air circulation, the bilge blower is to be used before starting the engine, during starting, and while the boat is operating below cruising speed. Operate the blower for at least four minutes before starting the engine.

**WARNING**

Operation of the blower is NOT A GUARANTEE that explosive fumes have been removed. If you smell any fuel, shut off the engine and all electrical accessories and investigate immediately.

Bilge Pump

The electric bilge pumps supplied with Bayliners are impeller-type pumps. They are controlled by a switch on the dash panel, which should be activated whenever water begins to accumulate in the bilge. Bayliner Motoryachts will also have an automatic bilge pump switch ("autofloat switch") mounted next to each pump. This is a float-type switch that will activate the bilge pump automatically whenever bilge water accumulates above a pre-set level. It is wired directly to the battery so it will normally function even when the boat is completely shut down and unattended, such as when the boat is moored at a marina.

Operation of bilge pumps should be checked frequently. To check bilge pumps, activate the dash-mounted switch and verify that any water in the bilge is pumped overboard. If bilge water is present and the pump motor is running but not pumping, check to see if the pump is clogged with debris. Squeeze the two holding tabs on the side of the pump housing inward and pop the pump's upper housing off. If the pump’s strainer well is clear but the pump still does not move water, check the discharge hose for kinks or a collapsed area.

The autofloat switch should also be checked frequently for proper operation, if your boat is so equipped. Squeeze the two holding tabs on the side of the switch housing inward and pop the upper housing off. Remove any debris you find in the strainer well. Then raise the float to verify it has full up and down movement. As you raise the float to its full upward position, the bilge pump should turn on and empty all bilge water overboard. If raising the float does not switch the pump on, check the in-line fuse in the wire between the switch and the battery. Make sure it has not blown. If the fuse is good, but the switch still does not work, it usually indicates a bad switch, or possibly a low battery. In either case, call your dealership for further assistance.
NOTICE

The Federal Water Pollution Control Act prohibits the discharge of oil or oil waste into or upon the navigable waters and contiguous zone of the United States if such discharge causes a film or sheen upon, or discoloration of, the surface of the water, or causes a sludge or emulsion beneath the surface of the water. Violators are subject to a penalty of $5000.

Navigation Lights

Although the night lights and navigation lights supplied with your yacht are of top quality, failure may occur for a variety of reasons:

1. There may be a blown fuse. (Replace the fuse in the switch panel.)
2. The bulb may be burned out. (Carry spare bulbs for replacement.)
3. The bulb base may be corroded. (Clean the base periodically and coat it with nonconductive grease.)
4. A wire may have come loose or may be damaged. (Repair as required.)

NOTICE

Prolonged operation of cabin interior lights (overnight) may result in a dead battery. Be conservative in the use of battery power.

Alcohol Stove

Carefully read and follow the manufacturer's operating instructions supplied with your stove, and observe the following:

1. Use only denatured alcohol labeled specifically for marine use.
2. Do not operate the stove while underway.
3. Do not fill the stove near an open flame or hot object.
4. All spilled alcohol should be wiped up prior to lighting the stove.
5. Don't put any cooking utensils on the stove until the burners are lit and functioning properly.
6. Pressurized Type

- **To fill:**
  Unscrew the cap and fill the tank using a funnel. Replace the cap (the filler cap is equipped with a safety valve and must not be replaced with any other type of cap).

- **To start:**
  Pump approximately 20 times to pressurize the tank and slowly open one burner at a time to allow alcohol to flow into the priming cup below the burner body (fill the cup about 3/4 full). With the burner off, ignite the priming alcohol. When the priming alcohol is fully consumed, turn the control knob toward the OPEN position and light the burner.

**WARNING**

Flare-up may occur during preheating, particularly if the burner valve is opened before preheating has been completed. If flare-up occurs, shut off the burner and restart the stove.

7. Nonpressurized Type

- **To fill:**
  Close both burners and completely loosen the retaining screw in the middle of the stove's front. Pull the top forward (towards you), disengaging the pegs at the rear, and lift the top of the stove up (lift at the middle of the grid to help keep the top horizontal). The stove top must only be lifted when the burner openings are completely covered by the regulating plates (burners are closed). Providing all flame has been extinguished and there is no heat glow on top of the tank, the tank unit can be lifted out.

The tank openings are recessed to facilitate filling; pour the fuel directly into the opening covered by the wire mesh. Check the fuel quantity by raising the tank to the vertical position. When fuel is visible in the recess, discontinue filling.

After filling, make certain no excess fuel remains in the stove. Always wipe the tanks dry. Place the tanks in the stove. Check to see that they fit properly in their mountings.

Make certain that both burners are closed and follow the steps shown above in reverse order to reassemble the stove.
• **To Light:**
  Turn the regulator knob counterclockwise (towards the + sign) to open the burner. Place a lighted match at the tank opening. (The match can be dropped in and removed at the next filling). If the stove is warm (from previous use), the burner may ignite suddenly and then instantly snuff itself out. If this happens, blow down into the burner opening to dissipate any alcohol fumes before attempting to relight the stove.

• **To Extinguish:**
  Turn the regulator knob clockwise (towards the - sign) to close the burner. Winterize your stove by burning all remaining fuel, and by following the directions provided in the manufacturer's instructions.

8. Electric Burners (if so equipped):

• *Never* attempt to use both alcohol and electric burners simultaneously. To do so will cause overheating which can destroy the electric burner elements.

• After removing the cutting board or cover, turn the appropriate burner knob to the desired setting. Make sure both alcohol burner knobs are in the closed position. The electric burner element will then heat-up fairly rapidly for use in cooking.

• When finished, turn the knob to the OFF position and allow the burner to cool-down completely before replacing the cutting board or cover back on the stove.

9. Regularly clean the stove as described in the owner's instructions that come with the stove.

**Electric Stove**

Carefully read and follow the manufacturer's operating instructions supplied with your stove. Note that the stove breaker switch must be ON in order to operate the stove.

**Loading Limits**

2. Hardtops: 100 pounds maximum.
3. Transom platforms: 250 pounds maximum.
GENERAL MAINTENANCE AND REPAIRS

In addition to instructions found elsewhere in this manual and in the literature specific to certain components, the following information is provided for general maintenance and repair.

Because conditions vary widely in different areas, and since frequency and type of use can differ greatly between owners, intervals for maintenance are not listed here. Common sense should determine the frequency of maintenance.

Bilges/Engine Compartment

1. Pump the bilges dry and remove all loose dirt. Be sure that all limber holes are open. If there is oil in the bilge and the source is not known, look for leaks in engine oil lines or engine gaskets. Oil stains can be removed by using a bilge cleaner available from your dealer or a marina. **DO NOT** use flammable solvents.

2. Check all wiring to be sure it is properly supported, that its insulation is intact, and that there are no loose or corroded terminals. If there are corroded terminals, they should be replaced or thoroughly cleaned with sandpaper. Tighten all terminals securely and spray them with a light marine preservative oil.

3. Inspect the entire fuel system (including fill lines and vents) for any evidence of leakage. Any stains around joints could indicate a leak. Try a wrench on all fittings to be sure they are not loose, but do not overtighten them. Clean fuel filters and vent screens. Operate all valves to be sure they are in good condition.

4. Inspect the entire bottom for evidence of seepage, damage or deterioration, paying particular attention to hull fittings, hoses, and clamps. Straighten kinked hoses and replace any that do not feel pliable. Tighten loose hose clamps and replace those that are corroded. Tighten any loose nuts, bolts, or screws. Operate seacock to be sure they are in good condition.

5. Refer to your engine operating manual for engine maintenance details. Wipe off engines to remove accumulated dust and grease. If a solvent is used, make sure it is nonflammable. Go over the entire engine and tighten nuts, bolts, and screws, including the mounts. Inspect the wiring on the engine and clean and tighten the terminals. Inspect the belts and tighten them if needed. Replace any belt that is cracked or frayed. Clean and lubricate the battery terminals; fill the cells with distilled water as needed.
Cabin and Topside Areas

1. Test all electrical equipment and appliances to make sure they operate properly. Inspect all wiring for proper support, sound insulation and tight terminals. Pay particular attention to portable appliance cords and plugs.

2. Inspect and operate all heads, basins, showers and sinks. Also inspect the freshwater system plumbing, including the tank. Check and operate the water pumps, including the shower pump and sink drain pumps. Check all water lines and connections for leaks, and make sure all connections are tight.

3. Check bow rails, ladders, and grab rails for loose screws, breaks, sharp edges, etc., that might be hazardous in rough weather. Inventory and inspect life jackets for tears and deterioration. Check your first aid kit to make sure it is complete. Check the signalling equipment. Inspect anchor, mooring and towing lines and repair or replace as required. **DO NOT** stow wet lines or they may mildew and rot.

4. Salt and brackish water are capable of etching and damaging window glass. Keeping windows clean is the best preventive measure you can take. When window cleaning, flush with plenty of fresh water.

   Excercise caution when cleaning windows and doors made of plexiglass because it tends to scratch easily. First, use generous amounts of water to wash off as much dust as possible. Use your bare hands with plenty of water to dislodge any caked dirt. Then use a soft, grit-free cloth or clean, soft sponge with a cleaner made specifically for plexiglass. Never use a glass cleaning solution or a duster, as these will scratch the surface. **DO NOT** use solvents such as acetone, kerosene, benzine, carbon tetrachloride, fire extinguisher fluid, dry cleaning fluid, or lacquer thinner since they will attack the surface. When you are finished, rinse with fresh water and dry with a clean, damp chamois using a blotting action.

5. To keep teak looking fresh, it should be treated with teak oil at least twice a year (more often if exposure is severe). If the teak is in particularly bad condition ask your Bayliner dealer about a good teak refurbishing kit.

6. Stainless steel railings and fittings should be cleaned with soap and water or household glass cleaner. Because irreversible pitting will develop under rust that remains on stainless steel for any period of time, it is best to remove rust spots immediately with brass, silver or chrome cleaner. Then coat the railing or fitting with a good automo-
bile or boat wax. Never clean with mineral acids or bleaches. Also, do not allow stainless steel to come into continuous contact with iron, steel or other metals which could cause contamination leading to rust or corrosion.

7. A variety of high quality fabrics have been used in the construction of your boat. Proper care and cleaning of all fabrics on a regular basis will contribute to their long life. The most important thing to remember is that stains must be cleaned up immediately if the original beauty and strength of the fabric are to be maintained over a long period of time. Independent laboratory testing has shown that some sunscreen lotions and oils can permanently stain most types of vinyls and fabrics, so exercise care when using these products.

Prior to cleaning any fabric, we suggest that you test your cleaning solution and method on a hidden or inconspicuous area. That way, if that particular cleaning method causes damage, it will be confined to a small, less noticeable area.

Use a sponge or very soft scrub brush and a mild soap and warm water solution to clean exterior fabrics. Rinse after scrubbing with plenty of cold, clean water and allow the fabric to air dry in a well ventilated place, preferably away from direct sunlight.

Convertible tops, Naugahyde® dash panels (if your boat is so equipped), and vinyl upholstery can be cleaned using a mild soap and warm water solution also. Rinse after scrubbing with plenty of cold, clean water and air dry in a well ventilated place, again preferably away from direct sunlight.

Vinyl cleaners and conditioners are NOT recommended for use on Bayliner upholstery, as they tend to remove plasticizers that extend the life of the fabric. To prevent rainwater seepage at the seams, a coating of Scotch Gard® can be applied.

Mildew can occur if your boat does not have adequate ventilation. Heat alone will not prevent mildew; you must also provide for fresh air circulation. If mildew does occur, it often can be removed using a solution of warm water and laundry bleach (one cup of bleach to one gallon of warm-water). Brush the solution into the affected area, let it sit for 10 to 15 minutes, and rinse with plenty of cold, clean water. Air dry in a well ventilated place, once again preferably away from direct sunlight.

If at all possible, the vinyl top parts of your boat should be stored indoors in a fairly warm, dry place. This will greatly extend the life of the material.
Dry cleaning should be considered for interior fabrics other than vinyl.

8. When instruments are exposed to a saltwater environment, salt crystals may form on the bezel and the plastic covers. These salt crystals should be removed with a soft, damp cloth; never use abrasives or rough, dirty cloths to wipe plastic parts. Mild household detergents or plastic cleaners can be used to keep the instruments bright and clean.

**Hull**

1. The finish on a fiberglass boat is similar to that of an automobile and will respond to the same system of care and cleaning.

   Use a sponge and a mild soap and warm water solution to clean exterior surfaces of your boat. Rinse the boat well with plenty of clean water. You can use either boat or automobile wax to protect the finish, but avoid waxing polyethylene swim platforms, as they can be destroyed by the chemicals in some waxes. Note that there are a variety of polishes and cleaners for fiberglass on the market. We suggest that you experiment with different brands to determine which work best for you.

2. Almost unavoidable during the life of your boat is damage to the gelcoat or colored surface. This is not as serious as you might think. Repair is not costly and can be done by the novice.

   **Scratches:** If the scratch does not penetrate the gelcoat surface, it can be repaired with automotive rubbing compound. Dampen a soft rag and apply the compound by rubbing in a circular motion. The scratch may not disappear completely; however, its noticeability will decrease.

   **Gouges and Chips:** To repair, obtain “patch paste” from your Bayliner yacht dealer and follow this recommended procedure:

   - Clean the area to be repaired of wax and oil. Acetone is a good solvent.
   - Mix a small portion of patch paste and catalyst on a piece of cardboard according to the manufacturer’s instructions.
   - Apply the paste to the gouge with a putty knife or flat-edged stick; try to match the paste to the surface contour of the area being repaired. It is better to have an excess of paste, rather than not enough.
   - Allow the paste to harden thoroughly. In most climates, one to two hours should be sufficient.
• Shape the patch as desired using fine wet sandpaper.
• Finish by using automotive rubbing compound in the same manner as you did for small scratches.

**WARNING**

Teak oil, acetone and catalyst are hazardous materials and should be used only in well ventilated areas. Follow the manufacturer’s instructions. Also, never store rags that have been wetted with acetone, teak oil, fuel or any other solvent aboard your boat. Immediately remove them from the boat and discard them to prevent spontaneous combustion and fire.

3. The bottom paint on boats is designed to dissolve slowly to prevent marine growth. Therefore, it is unusual to find a boat bottom that does not need repainting after a season’s use.

   Periodically haul the boat out of the water and scrub the bottom with a bristle brush and a solution of soap and water. It is not always necessary to repaint the bottom each time it is scrubbed, but no bare spots should be permitted.

   Our recommended procedure for repainting the bottom is as follows:

   • Prepare the bottom by sanding, cleaning and fairing as required.
   • It is imperative that the new paint be applied over a perfectly dry surface. Fiberglass hulls should never be hauled, painted and relaunched on the same day, since this does not allow sufficient time for the moisture which has been absorbed into the old paint to completely dry out. Generally, 24 - 36 hours of drying time is required.

**NOTICE**

Bayliner recommends the application of an epoxy barrier coating, such as International Paint Company’s Interlux "Interprotect 2000 System", to help seal the hull bottom and reduce the possibility of gelcoat blistering on any boat that is permanently moored. The barrier coating should be covered with several coats of antifouling paint. Note that many states regulate the chemical content of bottom paints in order to meet environmental standards. Check with your local Bayliner yacht dealer about recommended bottom paints, and about laws that are in effect in your area.
4. Whenever your boat is out of the water you should check all metal parts for stray current corrosion. Stray current corrosion, or electrolysis, can be prevented several ways. The following are the most common causes and the simplest cures:

- Wiring may leak a certain amount of electricity. Keep a clean, dry bilge.
- A poorly grounded zinc anode: Check the ground wire and clean the contact surfaces.
- The zinc anode may be deteriorated beyond effectiveness: Replace it when it has deteriorated 50% or more.
- If your boat is permanently moored, we recommend that you contact someone in your area specializing in corrosion control and have them check your boat in its moorage to see that it is properly protected.

Also, while your boat is out of the water, propellers, rudders, and shafts should be inspected for damage.

5. Every attempt has been made to equip your boat with a propeller that will optimize performance. Changes in altitude and load can affect performance; therefore, your boating needs may dictate a propeller change. Your Bayliner yacht dealer can help you in the selection of propellers better suited to your needs.

If your boat is equipped with twin rudders, check to see that they are properly "toed-in" by measuring the distance between the leading edges of both rudders; then measure the distance between the trailing edges. The distance between the leading edges should be 1/4\" less than the trailing edges. Adjustment is performed at the transom, inside the engine compartment.

6. Flapper valves on cockpit scuppers should be checked often to see that they are pliable and are providing the proper sealing action.

**STORAGE**

The following suggestions are offered for storage at the end of your boating season:

1. If your boat is to be stored out of the water, it is extremely important that its hull is properly supported to avoid permanent hull distortion. If your boat is stored inside, it should be in a well-ventilated building.

2. A temporary winter cover is recommended if covered storage isn't available. A proper winter cover should keep the weather off the boat, but still provide adequate ventilation. Wrapping a boat in a
tight plastic cover can do more damage than good. Dampness and lack of air circulation provide ideal conditions for the fungi that cause mildew and dry rot.

3. Remove the batteries from the boat. Fill the cells with distilled water to the proper level and store the battery in a warm place. A fully charged battery will survive storage better than one that is not.

4. Refer to your engine manual for engine storage instructions.

5. Drain the freshwater tanks and lines by opening all faucets and operating the water pump (be sure that the hot water tank power switch is turned OFF). Operate the pump until all tanks and lines are empty and no water flows from any of the faucets. Also, drain the pump to prevent damage that can result from freezing.

6. Flush each head several times. If the boat is to be stored in salt-water, close the intake seacock, add fresh water to the bowl and allow it to stand for a day or more to dissolve accumulated salt. Then, with the seacock closed, flush the head until it is pumped dry. Pump out the holding tank.

7. Fuel tanks should be filled so there is little air space, thereby minimizing condensation.

8. Refer to your engine manual for storage procedures related to the engine seawater cooling system.

9. Thoroughly clean your boat. If possible, remove cushions, mattresses, blankets, towels, and other items that can hold moisture and cause mildew. Such items left on board should be positioned for maximum air circulation. Stand mattresses and cushions on edge. Prop open doors, hatches, cabinets and ski lockers to allow fresh air to circulate.

10. Defrost and dry out the refrigerator and freezer; leave the doors propped open. Leave all drawers and locker doors open.

11. Clean all deck hardware; then coat the hardware with rust inhibitor.

12. Lubricate the steering mechanism and throttle control linkage.

13. Close all seacocks.
14. Provide as much heat and ventilation for interior spaces as is safe and practical.

We hope these preventive measures will help make getting ready again in the spring easier. Should you have any questions, your Bayliner yacht dealer is ready to provide assistance.
NAUTICAL TERMS

ABEAM: To one side of a vessel, at a right angle to the fore-and-aft line.
AFT: Near or at the stern.
BEAM: The width of the hull.
BILGE: The lowest portion inside a boat (in a fiberglass boat, generally the underdeck and lower portion of the engine compartment).
BOW: The forward portion of the boat.
CHINE: The intersection of the side and bottom of a V-bottom boat.
DRAFT: Vertical distance from the waterline of the boat to the lowest point of the boat.
FATHOM: A measurement of six feet, generally used to measure water depth.
FREEBOARD: Vertical distance from the deck to the waterline.
GUNWALE: The upper edge of the side of a boat.
HATCH: A deck opening providing access to the space below. Normally fitted with a cover.
HEAD: Toilet or toilet room.
HELM: The tiller, wheel, and other steering gear.
KEEL: The lowest external portion of the hull.
KNOT: Nautical mile per hour; one nautical mile is 6,076 ft.; a land mile is 5,280 ft.
LEE: The direction toward which the wind blows.
PORT: To the left side of the boat facing forward.
PORTLIGHT: A hinged window in the boat's cabin or hull.
SCUPPER: An opening in a deck or cockpit permitting water to drain overboard.
STANCHION: A fixed, upright post used for support (of rails or lifelines).
STARBOARD: To the right side of the boat facing forward.
STERN: The after portion of the boat.
STERN DRIVE: Inboard/outboard propulsion unit.
TRANSOM: The transverse part of the stern.
WINDWARD: The direction from which the wind is blowing.
WARRANTY

Limited Warranty

Bayliner warrants to the original purchasers of its 1992 model boats, purchased from an authorized Bayliner dealer, operated under normal, noncommercial use that the Selling Dealer will: (A) Repair any structural hull defect which occurs within five (5) years of the date of delivery; and (B) Repair or replace any parts found to be defective in factory material or workmanship within one (1) year of the date of delivery.

What Is Not Covered

This warranty does not apply to: (1) Engines, drive trains, controls, props, batteries, or other equipment or accessories carrying their own individual warranties; (2) Engines, parts or accessories not installed by Bayliner; (3) Window breakage or leaks; cosmetic gelcoat finish, i.e., discoloration, blisters, cracks or crazing; (4) Hardware, vinyl tops, vinyl and fabric upholstery, plastic, metal, wood or tape trim; (5) Any Bayliner boat which has been altered, subjected to misuse, negligence or accident, or used for racing purposes; (6) Any Bayliner boat which has been overpowered according to the maximum horsepower specifications on the capacity plate provided on each Bayliner outboard boat; (7) Any Bayliner boat used for commercial purposes; (8) Any defect caused by failure of the customer to provide reasonable care and maintenance.

Other Limitations

THERE ARE NO OTHER EXPRESS WARRANTIES ON THIS BOAT. TO THE EXTENT ALLOWED BY LAW:

1. Any implied warranty of merchantability is limited to the duration of this written warranty.

2. Neither Bayliner nor the Selling Dealer shall have any responsibility for loss of use of the boat, loss of time, inconvenience, commercial loss or consequential damages.

3. Some states do not allow limitations on how long any implied warranty lasts, so the above limitation may not apply to you. Some states do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation or exclusion may not apply to you. This warranty gives you specific legal rights, and you may also have other rights which vary from state to state.

Your Obligation

In order to comply with Federal regulations, it is essential that your warranty registration card be submitted within 30 days of delivery of your boat. Return of this card is a condition precedent to warranty coverage. Before any warranty work is performed, we require that you contact your Selling Dealer to request warranty assistance. We require that you return your boat, at your expense, to your Selling Dealer or, if necessary, to the Bayliner factory. You will be responsible for all transportation, haulouts and other expenses incurred in returning the boat for warranty service.
